PROFILE

Product engineer who ships and operates Next.js / TypeScript products end to end — interface, API, PostgreSQL data model, deployment and the search and performance work that follows. Two years of production SaaS delivery, currently sole engineer on TerraLot for VegaWest under a paid contract. Seven prior years running my own businesses, so I read requirements as an operator, not just a ticket. I build with AI agents daily — coding, review and internal tooling — and treat their output as something to be tested, not trusted.

EXPERIENCE

Contract AI Product Developer May 2026 – Present
VegaWest · Remote

Sole engineer on TerraLot, an acquisition-intelligence and operations platform for the U.S. vacant-land market — parcel discovery, underwriting, competitor monitoring, owner outreach and owner-financed resale workflows.

- Built geospatial ingestion and research pipelines covering **565,930+ off-market leads across 15 states and 213 counties**, plus 208,442 comparable sales and 1.3M+ live-measured vacant parcels — re-architected to run unattended and interruption-tolerant on a Linux VPS once local execution proved unviable at that volume.
- Delivered a production Next.js platform with **120 pages and 79 API routes**: mapping, property scoring, provider abstraction, resumable jobs, retries, circuit breakers, usage caps and data-quality safeguards.
- Established source-verification discipline for public records after finding that recorded sale prices misrepresent purchase prices, preventing downstream valuation errors.

Independent AI & Web Product Developer Feb 2026 – Present
NocturnDev · Remote · freelance since 2018

Design, build and operate Next.js / TypeScript products end to end — interfaces, APIs, PostgreSQL data models, integrations and the deployment and monitoring that keep them running.

- Built retrieval-augmented AI products where every answer is traceable to a source document — hybrid retrieval, citation grounding, abstention when evidence is missing.
- Shipped multi-tenant SaaS on PostgreSQL row-level security with role-based access control and audit logging, serving isolated client tenants in production.
- Delivered a Meta Marketing API advertising cockpit for medical practices; led a security remediation pass covering IDOR exposure, token encryption at rest and Meta App Review requirements.

Business Owner & Operations Manager 2018 – 2025
Hospitality Ventures · Samsun, Türkiye

- Ran multiple ventures end to end (P&L, suppliers, staff, sales) while building their landing pages, local SEO and internal reporting automation — where the product-and-operator instinct comes from.

SELECTED PRODUCT WORK

ToolCompare / Programmatic Search Platform — EN-market comparison catalogue on Next.js. Diagnosed and fixed an index-root defect: indexable sitemap corrected from 1,731 to 1,160 URLs, pages with verified content 231 → 338, and 107 tools released from a content lock.

LegalFetch / Legal AI — Citation-grounded legal RAG over a 1.04M-passage corpus: hybrid retrieval, PII masking, abstention when sources are insufficient, document analysis and drafting.

ClinEntra / Clinical-Trial Evidence Workspace — Evidence-first workspace over public ClinicalTrials.gov data: field-level change detection, provenance records, a human-reviewed decision ledger, organisation isolation and fail-closed integrations. In live pilot use.

Live — toolcompare.net · gelecekfinans.com · nocturndev.vercel.app

OPEN-SOURCE CONTRIBUTIONS

Merged — honojs/hono and honojs/website: documented an RPC promise-chain type-inference limitation and extended the Context JSDoc. kutaygunal/kzip: eliminated BufferPool memory bloat and added path-traversal guards with early CRC failure.

Under review — railwayapp/railpack: semver range resolution for package.json > engines, .dockerignore-aware build planning, and a Laravel build-cache ordering fix that silently routed first-deploy migrations to the wrong database. Further contributions open at oven-sh/bun, vercel/ai and modelcontextprotocol/typescript-sdk.

TECHNICAL TOOLKIT

Core: TypeScript, Next.js, React, Node.js, PostgreSQL (Prisma/Drizzle, PostGIS, row-level security), Claude API & RAG (Qdrant), Python data pipelines, Docker on Linux VPS, Vercel

Practices: Product engineering from spec to production, REST APIs, ETL at scale, multi-tenant architecture, automated testing & CI/CD (GitHub Actions), AI-assisted development and agent tooling, technical SEO & performance, OWASP-oriented security review

Languages: Turkish (native) · English (professional working proficiency) · Spanish (A2)

EDUCATION

B.Sc. in Mechatronics Engineering — Bahçeşehir University, Istanbul, Türkiye 2015
